

Cable Management System

The TES Cable Management System is designed to keep your charging station cables clean and organized. In addition to further enhancing the look of your property. Electric vehicle drivers can easily extend the cable to the length required for their vehicles' charge port. The lanyards support the charger cable to keep it above the parking lot surface at all times. When the charging session is complete, the driver simply returns the plug to the end of the unit housing and the cable automatically retracts to form a clean, organized loop. The Cable Management System can be wall mounted as shown on the left or used with a single or dual pedestal as shown below.
